● Private recruiter portfolio · Germany-focused · AI + Cloud Security Operations

AI automation for IT, cloud security operations, and agentic workflows.

A proprietary portfolio concept for headhunters and recruiters: 14 years of infrastructure and systems experience, repositioned around Hermes/OpenClaw-style agents, Microsoft 365/Azure security, Copilot readiness, identity hardening, and practical automation that runs on a VPS through Telegram.

[View flagship case study →](#)[Recruiter one-page fit](#)[Compare portfolio angles](#)

hermes-secops-agent / private VPS

```
$ run daily_m365_security_readiness
✓ collect: Entra ID policy checklist, risky consent controls
✓ inspect: SharePoint/Copilot readiness questions
✓ generate: recruiter-safe executive summary
! flag: manual tenant verification required before client use
```

agent.pipeline

- └ Telegram intake + notifications
- └ local memory / Obsidian-style notes
- └ Azure/M365 security checklist automation
- └ FinOps / GenAI cost-control module
- └ human approval gates for sensitive actions

positioning: senior IT infra + cloud security + AI agent operations

Not “AI chatbot”.

Positioned as an operations layer: agents, memory, checklists, evidence, notifications, and safe handoffs.

Not pure DevOps.

Anchored in real IT infrastructure, Windows/M365/Azure, identity, endpoint, support, VMware/labs, and troubleshooting.

Germany recruiter framing.

Targets Cloud Security Operations, AI Automation Engineer, M365/Azure Security, Infrastructure Automation, and Copilot Readiness roles.

Two portfolio angles, one coherent story.

Use Angle A for conservative enterprise recruiters. Use Angle B for AI-forward teams, startups, and automation-heavy cloud/security roles.

Angle A — Enterprise Cloud Security Ops

Lead with Microsoft 365/Azure security, identity hardening, Copilot readiness, Zero Trust, Conditional Access, and operational checklists.

M365

Azure

Entra ID

SecOps

Angle B — Hermes/OpenClaw-style Agent Operations

Lead with a 24/7 AI automation layer: VPS agent, Telegram interface, local memory, sub-agents, watchdogs, and human approval gates.

Hermes

Agents

Telegram

VPS

Angle C — Hybrid AI Infrastructure

The strongest combined positioning: senior infra engineer who can make agentic automation reliable, auditable, and safe for IT/cloud operations.

Hybrid cloud

FinOps

Automation

Reliability

Flagship case study: Hermes SecOps Copilot.

A recruiter-safe case study title. It sounds enterprise-relevant without exposing private implementation details.

Problem

- Cloud/security teams drown in repetitive checks: identity, consent, mailbox rules, Copilot readiness, exposed management paths.
- AI tools are useful but fragile without memory, auditability, operational guardrails, and human approvals.
- Recruiters need proof of current AI automation capability, not just years of infrastructure experience.

Solution architecture

A private Hermes/OpenClaw-style agent running on Linux VPS, reached via Telegram, backed by local memory and structured runbooks. The portfolio version demonstrates the operating model; client/tenant execution requires explicit authorization.

INPUT

AGENT

MEMORY

Telegram / recruiter
prompt / checklist request

Hermes orchestration +
sub-agent tasks

Local notes, evidence,
decisions, reusable
runbooks

SECURITY

Human approval gates for
sensitive actions

MODULES

M365 readiness, FinOps,
cloud posture checks

OUTPUT

Executive summary, risk
list, next actions

Security operations themes recruiters understand.

These are concrete enough for hiring managers and broad enough to fit Germany roles.

M365 / Azure security automation

Identity hardening

Conditional Access, MFA posture, risky sign-ins, user consent restrictions, privileged access questions.

Copilot readiness

SharePoint permissions, oversharing, Purview labels, DLP, data exposure risk before AI rollout.

Security visibility

Defender for Cloud/Sentinel posture questions, mailbox compromise checks, canary-token style detection ideas.

Cost and reliability

FinOps and GenAI cost-control reminders, Azure OpenAI deployment cost gates, VPS/agent monitoring.

Agent operations discipline

Persistent interface

Telegram-first access for quick operational prompts and alerts.

- **Local memory**

Markdown/Obsidian-style memory to avoid multi-day context drift and preserve decisions.

- **Safe autonomy**

Human approval before irreversible actions, tenant changes, credential use, or outreach.

- **Evidence-oriented output**

Readable summaries, artifacts, blockers, and implementation locations rather than vague AI responses.

Recruiter one-line positioning.

Use this in LinkedIn, CV summaries, intro messages, or as the first paragraph of a portfolio PDF.

Senior IT infrastructure and cloud operations professional building AI automation for Microsoft 365/Azure security, Copilot readiness, identity hardening, hybrid cloud operations, and agent-driven workflows.
